TITLE: Dosing method of administering medicaments via inhalation administration or skin administration

Brief Summary Text (53):

Other potential improvements of pulmonary inhalation of drugs via an inhalator delivery system include the use of liposomes (microscopic phospholipid vesicles). The liposomal delivery of drugs slows the uptake of drug absorption from the lungs thus, providing a sustained drug release. (See, Hung, O. R., Whynot, S. C., Varvel, J. R., Shafer, S. L. and Mezel, M., "Pharmacokinetics of Inhaled Liposome-Encapsulated Fentanyl", Anesthesiol., 82:277-284 (1995).

TITLE: Freeze dried liposome encapsulated amphiphilic drug compositions and a process for the preparation thereof

Brief Summary Text (15):

The amphiphilic drug which is encapsulated in the liposomes which are freeze dried in accordance with the present invention may be a local anaesthetic, for example bupivacaine, ropivacaine, prilocaine, mepivacaine, tetrocaine or etidocaine, or a narcotic analgesic, for example morphine, fentanyl, alfentanil or sulfentanil.

TITLE: Injectable naltrexone microsphere compositions and their use in reducing consumption of heroin and alcohol

Brief Summary Text (28):

By having microspheres which have long-term releasing capability, that is, greater than 28 days, particularly greater than about 32 days, one can layer the administration, so that by giving injections in a periodic manner, one obtains an additive effect. In this manner, smaller doses may be administered after the first dose, because one continues to obtain release from the prior injected microspheres to which is added the release from the lately administered microspheres, or one can enjoy enhanced levels of the naltrexone without increasing the amount of the microspheres which are administered. By providing for microspheres that can continue to release at levels in excess of 1 ng/mL in blood, preferably in excess of 1.5 ng/mL in blood, more preferably in excess of 2 ng/mL in blood, greater than about 28 days after injection, frequently at least about 36 days, more frequently at least about 42 days. In this way protection is greatly enhanced, as the subject is continuously protected with a protective level of the naltrexone and one can provide levels of naltrexone which will inhibit response to a 50-mg challenge dose of heroin or an equivalent dose of a different drug, e.g. fentanyl.

Detailed Description Paragraph Table (2):
